Heterogeneity in the structures of outer membrane proteins of *Salmonella typhimurium*. *Salmonella typhimurium* has four outer membrane proteins (OMPs): OmpF, OmpC, OmpA, and PhoE. Two of these (OmpC and PhoE) are regulated by PhoP, but their function in this regulation is not yet clear. This paper reports the properties and structures of two PhoE OMPs, OmpE34 and OmpF N. OmpE34 and PhoE have the same N-terminus but different C-termini. Chemical cross-linking between these two OMPs demonstrates that the C-terminal region of OmpE34 has a cross-linking ability about 3 orders of magnitude greater than that of PhoE. After the removal of the N-terminal 23 amino acids of OmpE34, the C-terminal sequence of this truncated protein bears strong similarity to that of PhoE. The gene for OmpF N has been cloned and expressed in *E. coli*. The OmpF N is localized in the bacterial periplasm. The authors also determined the structure of OmpF N. OmpF N has a single alpha-helix which consists of 27 amino acids. This structure is similar to the alpha-helix found in most porins. In addition, the C-terminal region of OmpF N is also a target of PhoP regulation.

Q: Can a riding mower get stuck at end of drive chain? The rear of the riding mower is not level with the ground because the wheel is just a few centimeters higher than the ground. We mow a few grassy lots. When we are in drive, though, we can drive down an uphill hill. After a few times, the wheel gets stuck, forcing us to get off and lift the wheel off the ground. What are some typical failure points? Is it ok to tow the lawn mower uphill? Should we apply less pressure to the pedals when doing that? Is there a way to make the riding mower drive in either direction without getting stuck? How do you guys make sure that you don't get stuck? A: The big problem is when the chain is damaged and the sprocket is too high. Most chains fall
